

Why a SecuRam™ electronic Lock instead of a mechanical lock?

- 1. SecuRam is a leading manufacturer** – of high quality electronic security commercial and residential for safes, vaults and safety deposit boxes.
- 2. UL listed** – SecuRam locks are built to have a failure rate of less than 0.3%. Every unit undergoes a rigorous aging test for 2000 cycles.
- 3. Patented heavy duty Electronic Swing-bolt Actuator** – The average current of the motor is near 100mA, yet energy consumption is very low. It takes only 0.1 seconds for the motor to unlock or lock.
- 4. Code Sharing** – With a mechanical lock, once the combination has been set, it is expensive to change the code. Owners can easily change the default code to their own unique combination code with the SecuRam lock.
- 5. Automatic Locking** – With a mechanical lock, if you do not physically spin the dial each time you close the door, the lock stays in the open position, even if the door is closed. After 6 seconds, the SecuRam ECSL-0601A locks automatically.
- 6. Long Battery Life** – The battery only needs to be changed once a year. A new Duracell or Energizer battery will last up to 20,000 cycles and is completely accessible while the door is locked due to its convenient front sliding mounting.
- 7. Non-volatile memory** – The combination code is retained even if the battery has gone dead and is no longer powering the lock.
- 8. Stainless Steel Construction** – Entry pad housing and components are constructed of stainless steel for maximum durability and reliability.
